## Acquire Personal Access Token (PAT) in GitHub

1. Log into your GitHub account.
2. Create Personal Access Token
  - a. Settings

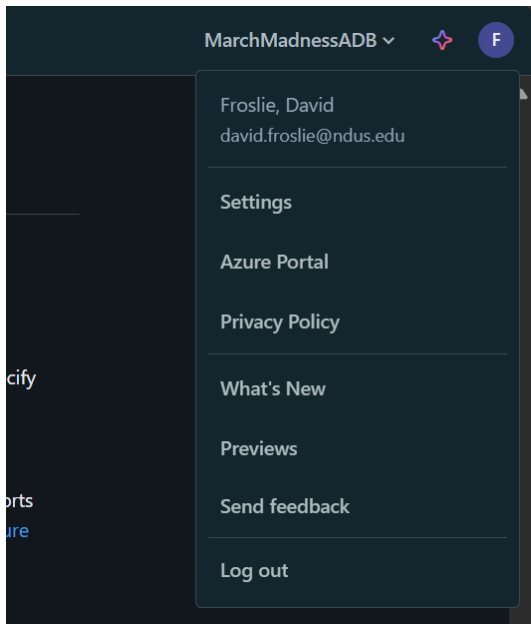

- b. Developer Settings (bottom choice on left)
- c. Personal access tokens -> Tokens (classic)
  - i. Name token
  - ii. Set expiration to the term of the class
  - iii. Check 'repo'
  - iv. Generate token
  - v. Copy and save the token for use in Databricks.

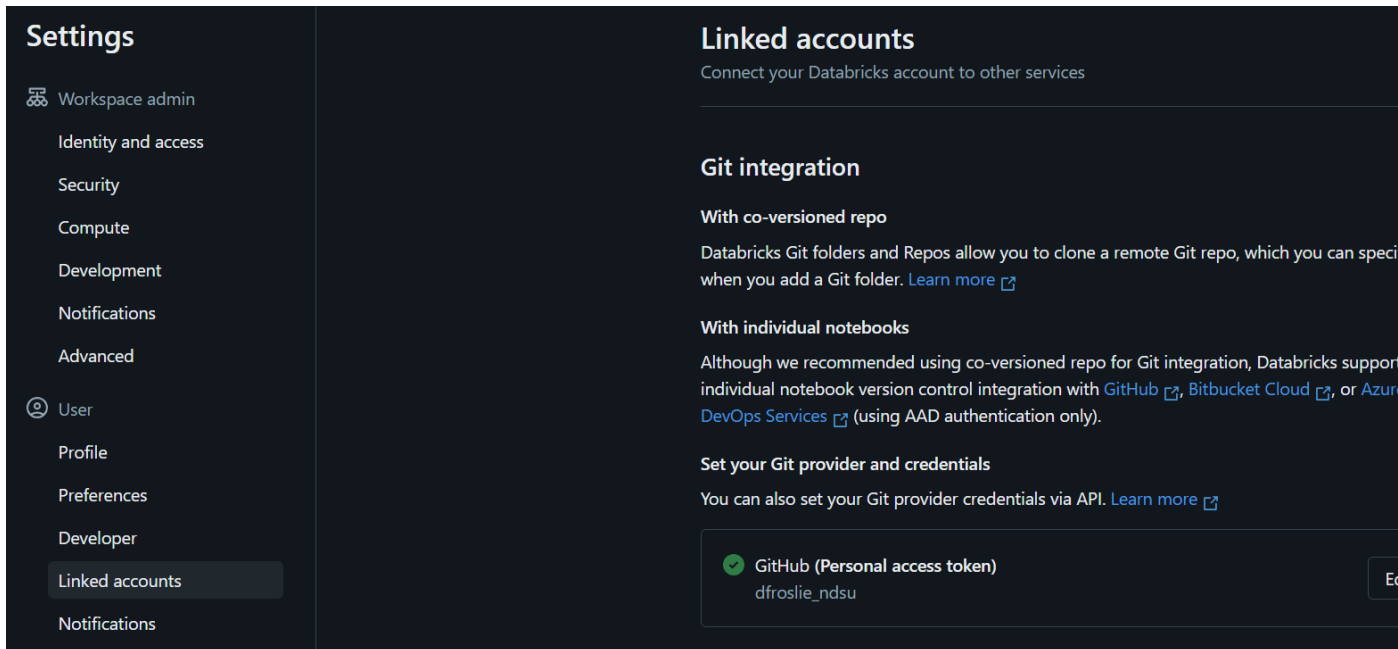

## Connect Repo In Databricks

Open your Databricks Workspace.

- Select Settings from the drop down menu in the upper right corner

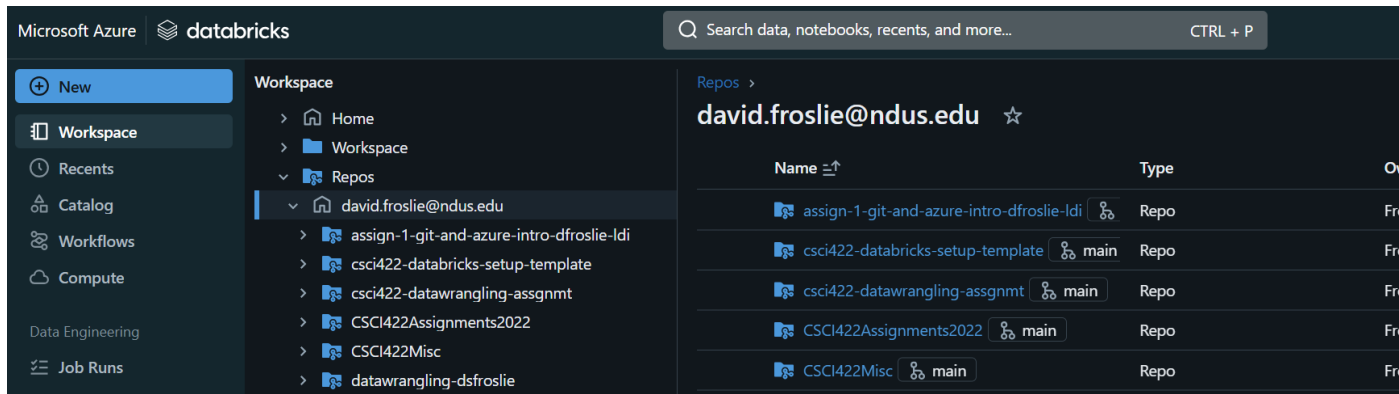

- Go to Linked accounts and Git Integration. Add your personal access token here.

Now to integrate the specific repo:

- Go to Workspaces on left hand menu of Databricks
- Click on your GitHub instance followed by Add->Repo on the right hand side of the page.
  - Note – You can also use 'Git folder (Recommended)' and you will find a new folder under your Workspace node. This is a new feature from Databricks that enables private

branches associated with specific users in a shared Databricks instance. We won't have that situation in class.

- Get the clone URL for the repo and paste it in. The Git provider and repository name should auto fill

## Add Repo

Location ⓘ

/Repos/david.frosilie@ndus.edu

☒ Create repo by cloning a Git repository

Git repository URL ⓘ

Git provider

Repository name

To create new notebooks, do so from the Repo menu:

Microsoft Azure
